## Class Diagram

This class diagram is derived by using a mix of verb-noun analysis and prototype analysis. The diagram shows how use cases flow and create the attributes from nouns, and the methods from verbs. When viewing this diagram, relationships can be seen between classes. The relationships between these classes help illustrate how many objects are associated between classes. Each class is made up of attributes, or characteristics, and methods, which define what the object can do. These relationships and classes were defined by looking at the prototypes that had been designed around the use-cases. This allowed our team to find the optimal way of organizing properties and operations within classes to best suit the needs of UofL's Basketball team.

## User Interface Navigation Diagram and Screen Layouts

The Window Navigation Diagram shows the fundamental parts of the system. It shows how users can interact with the system, as well as how windows, buttons, forms, and other objects interact with each other.

## Data Forms

These are mockups of input/output forms for the screen layouts of the UofL Basketball Team system. Each of the use cases and prototypes for the input screen layouts are to demonstrate what the users or the administrators should see as they navigate through the website.

### Create, Edit, Upload, Delete Players from Nutrition Page

Being able to change the nutrition page for the players is one of the important parts for the team players. Maintaining the player's nutrition improves diet and overall gameplay. Keeping the players healthy will result in better game statistics and a clear mind on the game. It's important for nutritionists to be able to create and edit the players' information accordingly. If there is any change in the players' diet, the nutritionists can edit the information and meet with the player to discuss any changes to their diet. With any new players or any players that will no longer be on the team, the nutritionists are able to upload any new medical information and delete older player information.

### Create, Edit, Upload, Delete In-Game Scores

Keeping records of in-game scores is crucial to improving the team's knowledge of their own gameplay. Being able to review the in-game scores will allow the coaches to oversee the players who are doing well and who need more practice on the side to help improve the team's play. The coaching staff will be able to create new in-game scores and delete any old or irrelevant game scores. If the coaching staff needs to fix any information, they can edit the scores to have a more accurate database to review. The coaching staff is also able to upload any in-game scores that they have in a spreadsheet when they were not able to upload them.

### Create Edit, Upload, Delete Player Statistics

Maintaining a log of each player's in-game statistics is pivotal to any team's success. For the players, to keep track of where they may be struggling and which aspects, they need to work on in practice to hopefully transition in a game. For the coaching staff, it is important to see the statistics of players as they give a basis of how each lineup should play. If need be, they can make adjustments and cater to the players' strengths. The coaching staff has the ability to create and edit this database at any given point. Once complete, they may upload the information for all to see. If for any reason information needs to be wiped off the database, the coaching staff can delete the unneeded information.

### Create, Edit, Upload, Delete Players' Practice Scores

The team's practice scores are an important part of its long-term success. To have all of the records for the past performances is essential to getting better. One must be able to see where they played poorly or aspects where they can improve during practice. Collecting practice scores gives a player a good indication of where they excel, and where they need to put the extra work in. The coaching staff with the proper access will be capable of creating and editing the Players' Practice Scores when wanting to keep record of past performances. Once the information has been properly created, the coaching staff can then upload the practice scores for everybody to be able to view. Finally, the coaching staff can delete any uploaded practice scores at any given time.

### Create, Edit, Upload, Delete Players' Training Reports

Maintaining training reports is an essential aspect for the basketball team. Given the ability to keep a record of all your past training numbers. To see where one exercise compares to the next. Viewing all the data and focusing on the workouts that require the most work. The coaching staff can create and edit each training report. From there, they have the ability to upload the training report for all to see. This is where the user(player) can have access to this information and look at where they need to improve. Finally, the training reports may be deleted if the coaching staff finds the information redundant or unneeded.

### Create, Edit, Upload, Delete Players' Injury Reports

Monitoring a player's physical health is vital to the construct of any team. Knowing each player's past injuries and keeping note of which areas players need to strengthen their body. It is important to have a database showing which players are available to suit up in the upcoming games. The coaching staff has the ability to create and edit the injury reports to their liking. Once complete, they may upload the information for all to see. Any unwanted information may be deleted and wiped off the database.

### Create, Edit, Upload, Delete Players' Medical Data

Keeping track of the medicine players are taking is important to the health of the team. To have a log showing all things medicinal related. Having a database that shows how long a player needs to take the medicine, what they are taking the medicine for, and if there are any side effects or impacts of taking said medicine. It is important to keep this data as accurate as possible and through the coaching staff's ability to create and edit information it is in their hands to ensure this. Once complete, the coaching staff may upload and delete the information at any time. Once uploaded, this gives everyone who has access to the database the ability to view the information.

## Gantt Chart

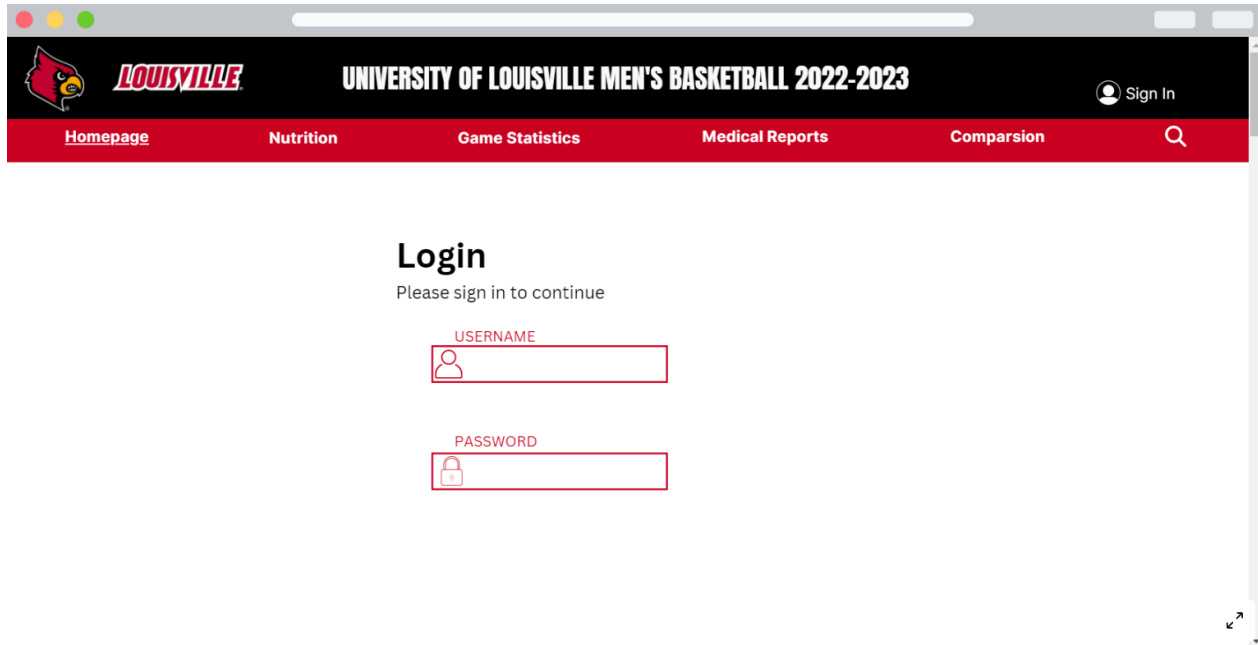

A Gantt chart is an important tool used in project management to help plan and appropriately schedule tasks among group members to successfully complete a project. Our Gantt chart visualizes the tasks for Iteration 5, displaying who was in charge of each section of work and the duration each task has taken. It allows for every team member to understand what is expected of them and have knowledge on any dependencies present between tasks, to be able to meet deadlines on time, and to prevent holding back another team member from beginning on their task. It allows for an organized workflow and helps visualize the project.
